

Use Case

eSIM - dual use phones

Corporate employees are often on the move and the need to bring both personal and business mobile devices can prove to be a hassle. eSIMs however give you the ability to manage multiple SIM profiles on a single device, allowing employees to transition seamlessly between business and personal needs without the requirement for multiple devices or physical SIM cards.

Increased flexibility

Managing multiple SIM profiles on a singular device ensures clear separation of work and personal communications, allowing employees to maintain professionalism and privacy while using the same smartphone. This increased choice is often a more attractive option for employees and allows businesses to save on business mobile hardware costs.

Reliable back up option

eSIMs are a reliable backup option for employees in case of network issues or emergencies. If a network experiences downtime or poor coverage in a particular area, employees can switch to an alternative network without disruption. Having this backup option drastically improves reliability and allows employees to stay connected even in challenging environments.

Additional data usage

eSIMs offer the flexibility to add additional data usage when on the move for both business and personal purposes. Whether attending meetings online or in-person, collaborating with colleagues or simply needing to access necessary resources and information while travelling, eSIMs work to keep you connected with the ability to add extra data on the go.

Summary

eSIMs are the perfect connectivity solution for businesses, allowing employees to manage multiple SIM profiles on a single device and reducing the need for additional hardware. With reliable backup options and the ability to add extra data usage, employees can stay connected & productive while travelling hassle free.
